CATALOGUE OF TYPES IN THE ROYAL ONTARIO MUSEUM
OF PALAEOONTOLOGY

By Madeleine A. Fritz
Assistant Director of Invertebrate Palaeontology

PART III

Two parts of the Catalogue of Types in the Royal Ontario Museum of Palaeontology have already been published. They constitute Contributions No. 5 and No. 6 of the Royal Ontario Museum of Palaeontology. These issues deal with biological groups ranging from the *Porifera* to the *Bryozoa* inclusive. In Part III, the present issue, which represents Contributions of Royal Ontario Museum of Palaeontology No. 7, the *Brachiopoda* are recorded.

The form of the catalogue is similar to that used in Parts I and II. That is to say in considering each type the current generic and specific name appears in capital letters at the left side of the first line. The species name is followed by that of the original author, and it in turn by the particular kind of type represented, together with the number of specimens. In certain instances where the specific name has been changed the original name is indicated in italics on the second line. Then follow in order the literature reference or references, general geological age and more specific geological horizon, the locality, and the catalogue number. It will be noted that both genera and species are arranged alphabetically.

A large number of the types dealt with in this Part belong to the George F. Matthew Collection of Cambrian Fossils, which was presented to the Museum in 1904 by Sir Wm. Mackenzie.

In working over these types many difficulties were encountered. For instance, in Matthew's time it will be remembered that it was not the custom to differentiate among type specimens to the extent that it is now. In consequence, many of the specimens were designated merely as "types" by the author. Again, much of the material is unsatisfactory and poorly preserved. Furthermore, many of Matthew's illustrations appear to be composite drawings. In view of these circumstances it has not always been possible to identify the specimens with the original descriptions and illustrations. In certain instances where neither holotype nor paratypes were indicated by Matthew such specimens are regarded as cotypes. It is quite possible that some of these so-called cotypes may be heautotypes, metatypes, or topotypes.

In connection with the Matthew Collection it may be added that, besides the primary types listed here, a considerable amount of metatype and other comparative brachiopod material is also present.

The next Part of the Catalogue of Types in this Museum, which will appear at a later date, will deal with the various classes of *Mollusca*.
